

About Autofill

Your guide to faster documentation

We know you have many patients to treat, you're short on time and you want your EMR to help you document efficiently. We also know that common injuries like ankle sprains and muscle strains present with evaluation findings that are similar patient to patient. That's why we've created Autofill. This feature lets you create customized evaluation findings you can insert into the Objective section of your Open SOAP note or Short Note with the press of a button. And if your patient's evaluation differs a little from your Autofill, you can easily make edits on the fly.

Here's How it Works:

- Click on Account, Options, then Autofill Content
- Review the defaults that come with the system. You can edit these defaults, delete them and even create new ones. We realize ATs have their own style, phrases and abbreviations so we've given you the freedom to make them your own.
- While documenting using an Open SOAP or Short Note, click the Autofill Options tab, then select Use, and the text will automatically appear. Edit as needed.

ATGenius was developed for athletic trainers by an athletic trainer to help you document faster, stay organized and show your value.

Record Keeping Made Simple.
